COOK ISLANDS
STATISTICAL BULLETIN

GROSS DOMESTIC PRODUCT
June Quarter 2024

In the June Quarter of 2024, Gross Domestic Product (GDP) at current market prices grew by 10.9% quarter-over-quarter, rising from \$144.2 million in March Quarter 2024 to \$159.8 million in June. This growth was driven by a 16.5% expansion in service industries, particularly in accommodation (+\$9.5 million) and restaurants & bars (+\$1.9 million), reflecting an increase in tourism. The goods-producing sector grew by 33.2%, largely due to increases in mining and manufacturing (+\$1.3 million), while primary industries saw a slight increase, mainly driven by fishing. Year-over-year, current GDP rose by 10.6%, from \$144.5 million in June 2023 to \$159.8 million in June 2024.

GDP at constant prices grew by 13.7% quarter-over-quarter, rising from \$118.0 million in March Quarter 2024 to \$134.1 million in June Quarter 2024. This growth was driven by a strong service sector (+11.7%), particularly in accommodation services (+58.4%), real estates (+37.8%), restaurants and bars (+35.4%), and finance and insurance (+17.2%). Goods-producing industries also expanded by 27.7%, mainly due to increased construction activity. However, primary industries remained steady at \$2.3 million. Year-over-year, GDP at constant prices increased by 10.4%, from \$121.5 million in June 2023 to \$134.1 million in June 2024.

Graph 1 below shows total quarterly GDP at both current and constant 2016 prices.

Most information can be sourced from the tables attached or contact the Statistics Office for more information.

December 2024

Explanatory Notes

Gross Domestic Product (GDP) is the measure of economic growth in the Cook Islands.

GDP Compilation Approaches

There are three different approaches taken to calculate GDP - the production approach, the expenditure approach, and the income approach.

The production approach (GDP (P)) is being used to calculate the Cook Islands GDP on a quarterly basis. This approach measures the total value of goods produced in the Cook Islands, after deducting the cost of goods and services used in the production process. Generally, the GDP in this approach is calculated as, the total Gross Output (GO) less Intermediate Consumption (IC).

Scope and Coverage of the GDP

GDP is calculated for all economic activities in the Cook Islands. These activities include Agriculture and Fishing; Mining and Manufacturing; Electricity, Gas and Water; Construction; Retail and Wholesale Trade; Restaurants and Accommodation; Transport, Storage and Communication; Financial Intermediation; Real Estate, Renting and Business Services; Education, Health and Public Administration; Other Services; and Owner-Occupied Dwellings.

International Standard Industrial Classifications (ISIC Rev 4) – is used to classify the principal economic activity (industry) of establishments and enterprises. At the broader industry groupings:

- Primary industries include agriculture, fishing and pearl
- Secondary industries include mining and manufacturing; electricity and water supply; and construction.
- Tertiary or service industries include wholesale and retail trade; restaurants and accommodation; transport, storage, cartage and communication services; Finance and Business Services; Community and Personal Services; Public Administration; Education and Health Services; Ownership of Owner-Occupied Dwellings.

General information

Data Source

VAT data is the main data source in the compilation of GDP. Other data sources and methods are found in the table for the methodology of compiling the Cook Islands quarterly GDP on request.

System of National Accounts

The conceptual framework used to compile the Cook Islands GDP is based on the System of National Accounts 2008.

GDP Implicit Price Deflators

Implicit price deflators (IPDs) for expenditure on GDP provide a broad measure of price change for total economic activity. They provide an estimate of price change between the base period and any other period, using the quantity weights in the latter period. Because weights change from period to period, a change in an IPD between any two periods reflects changes in both actual prices and weights or compositional changes. It is calculated as GDP at current prices divided by GDP at constant prices and multiply by 100.

Per capita measures

A per capita measure is the annual GDP (at current or average prices) divided by the corresponding projected population of the Cook Islands. We use the average estimated resident population of the Cook Islands.

Base period for the GDP

The base period is the calendar year ending 31 December 2016.

Revision policy

We may revise previously published series each quarter. The frequency and cause of these revisions are listed below.

Quarterly – more data becoming available for the latest quarters, which is used to replace existing estimates.

Annual – introduction of annual data after the release of the latest annual national accounts.

Irregular – for example, methodological changes.

Publication Schedule

Compilation and release of calendar year GDP data is within six to nine months after reference year.
